In recent years, interest in landslide hazard assessment studies has increased substantially. They are appropriate for evaluation and mitigation programs in urban and rural areas, as they represent a significant number of deaths and damages. Landslide hazard assessment is an essential part of the management of landslide-prone areas.

The logistic regression model is a statistical model appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides. The logistic regression model describes the relationship of the presence/absence, which is the dependent variable and normally follows a 0 to 1 for two possible categories, with a set of independent variables X, which can be either qualitative or quantitative variables. The logistic regression model is appropriate for analysis of presence - absence of the dependent variable.

The logistic regression model is a statistical method appropriate for analysis of presence - absence of the dependent variable, which in our case is the evaluation of landslide susceptibility, such as the occurrence of landslides.
